ASIN是Amazon Standard Identification Number, 给定的数据集与原来的处理方式是一致的, 因此可以直接参考原repo得到加了prompt之后(按照alpaca格式)的dataset。

I tokenizer fast

是不是用fast tokenizer对结果影响不大

I prompt format

训练数据为140000个, 改为Qwen的格式, wandb链接:

Train:

"""Below is an instruction that describes a task, paired with an input that provides further context. Write a response that appropriately completes the request.

Instruction:

startl>

data_point["instruction"]

endl>

Input:

startl>

data_point["input"]

<im_endl>

Response:

startl>

data_point["output"]

endl>

~11111

Inference:

"""Below is an instruction that describes a task, paired with an input that provides further context. Write a response that appropriately completes the request.

Instruction:

startl>

instruction

endl>

Input:

startl>

input

endl>

Response:

learning_rate=0.0003, weight_decay=0.0, warmup_steps=50, per_device_train_batch_size=32, gradient_accumulation_steps=8
